

2023 AP Daily: Practice Sessions

AP Physics 1

Session 1 – MCQ

1. A Block of mass, M is at rest on a ramp that is inclined at an angle θ with respect to the horizontal. Frictional forces are considered to be nonnegligible. The block is pushed against a spring and then held in place. The spring is compressed a distance of x_1 , and the spring is not secured to the block. The block is then released from rest, travels up the incline, and comes to rest after traveling a distance D , as shown. Which of the following claims correctly describes the energy of the system under consideration from when the block compressed the spring and when the block has traveled a distance D along the incline? Select two answers.
- A. The mechanical energy of the system consisting of the spring increases by $\frac{1}{2}kx^2$.
 - B. The mechanical energy of the system consisting of the block does not change.
 - C. The mechanical energy of the system consisting of the block and Earth
 - D. increases by more than zero but less than $\frac{1}{2}kx^2$.
 - E. The mechanical energy of the system consisting of the spring, block, and Earth increases by $\frac{1}{2}kx^2$.

2. An inclined track is secured to a table. The height of the highest point of the track above the tabletop is h_1 . The height from the tabletop to the floor is h_2 . A block of mass M is released from rest and slides down the track such that all frictional forces are considered to be negligible. The block leaves the track horizontally and strikes the ground at a distance D from the edge of the track as shown. Which of the following statements is correct about the scenario? Select two answers.
- A. If the block is released from a height $2h_1$, the block will land at a distance $2D$ away from the end of the track.
 - B. If the block's mass is increased to $2M$, the block will land at a distance $2D$ away from the edge of the track.
 - C. The total mechanical energy of the system containing only the block increases from the moment of release to the moment it strikes the ground.
 - D. The total mechanical energy of the block-Earth system remains constant.

A clay ball of mass $2m$ is moving horizontally with speed v_0 just before colliding with a block of mass m , as shown above. The block is suspended from a light string with length L . The clay sticks to the block, and the block swings up to a maximum height h_0 above the block's initial position (where $h_0 < L$). The block then oscillates about its lowest position with period T_0 .

Which of the following quantities is the same immediately after the collision and at the instant the block reaches height h_0 ?

- A. Linear momentum of the clay-block system.
- B. Angular momentum of the clay-block system about the top of the string.
- C. Total mechanical energy of the clay-block system.
- D. Total mechanical energy of the clay-block-Earth system.
